

1)Write a Program that calculates the radius and the area of a circle,where the perimeter is entered by the user.(Rachel Batra)

```
--> fprintfprec : 4 $
    block (
    x : read ( "Enter the perimeter of the circle" ) ,
    y : x / ( 2 * ( %pi ) ) ,
    R : print ( "the radius of the circle is" , float ( y ) ) ,
    z : ( %pi ) * y * y ,
    A : print ( "the area of the circle is" , float ( z ) )
    ) $
```

//Entertheperimeterofthecircle/////24;

//theradiusofthecircleis/////3.82///

//theareaofthecircleis/////45.84///

2)Program that inputs five scores of semester III and calculates the total score and percentage.

```
--> fprintfprec : 4 $
    block (
    A : read ( "Enter your Intermediate Macro marks " ) ,
    B : read ( "Enter your Intermediate Micro marks" ) ,
    C : read ( "Enter your Stats amrks" ) ,
    D : read ( "Enter your GE - DE marks" ) ,
    E : read ( "Enter your DAmarks" ) ,
    F : A + B + C + D + E ,
    G : ( ( A + B + C + D + E ) / 550 ) * 100 ,
    print ( "your total marks in sem III:" , F ) ,
    print ( "your total percentage in sem III:" , float ( G ) )
```

) \$

//EnteryourIntermediateMacromarks/////70;

//EnteryourIntermediateMicromarks/////75;

//EnteryourStatsamrks/////62;

//EnteryourGE – DEmarks/////120;

//EnteryourDAmarks/////72;

//yourtotalmarksinsemIII ://///399///

//yourtotalpercentageinsemIII ://///72.55///

3)Program that finds the larger of the two numbers entered by the user.(Conditional Structure/If Statement)

```
--> block (
    x : read ( "enter your first number" ) ,
    y : read ( "enter your second number" ) ,
    if ( x > y ) then
```

```

print ( x , "is greater than" , y )
else
print ( y , "is greater than" , x )

```

) \$

```

//enteryourfirstnumber/////700;
//enteryoursecondnumber/////200;
700/////isgreaterthan/////200///

```

4)Program to convert celsius to fahrenheit and vice versa depending on user's input

```

--> block (
  x : read ( "enter your temperature" ) ,
  y : read ( "if your temperature is celsius then enter C or if fahrenheit enter F" ) ,
  H : float ( ( x · 9 / 5 ) + 32 ) ,
  G : float ( ( ( 32 · x ) - 32 ) · 5 / 9 ) ,

  if ( y = C ) then
    print ( "your temp in fahrenheit is" , H )
  else
    print ( "your temp in celsius is" , G )

) $

```

```

//enteryourtemperature/////36;
//ifyourtemperatureiscelsiusthenenterCoriffahrenheitenterF/////C;
//yourtempinfahrenheitis/////96.8///

```

-->
